

Project (CN6000)	Initial Proposal Form
Programme: Bsc (Hons) Data Science and Artificial Intelligence	Year: 2025
Student Number: u2536809	
Proposed Title: Unveiling Model Rationales: An Explainable AI Framework for interpreting Black-Box tumor predictions for Convolutional Neural Networks	
Proposed Aim:	
<p>The primary aim is to develop and evaluate an Explainable AI (XAI) framework that transforms opaque Deep Learning (DL) models into transparent and trustworthy decision-support systems for automated brain tumor diagnosis and screening.</p>	
Proposed Objectives:	
<ol style="list-style-type: none"> <li>1. To establish and analyse the distinct mechanisms for localizing relevant images features and quantifying features contributions to the final CNN model prediction.</li> <li>2. To investigate the fundamental trade-off between model accuracy and model transparency in high-stakes images, establishing a balanced rationale for the integration of the chosen XAI suite.</li> <li>3. To quantitatively evaluate the precision of the visual XAI output.</li> <li>4. To conduct quantitative analysis (Robustness testing) of the features contributions using XAI methodologies.</li> <li>5. To implement and train the proposed CNN model using available MRI images Dataset and integrate it with the post-hoc XAI techniques to create unified Explainable hybrid model.</li> <li>6. To utilize the interpretability insights provided by XAI to prune CNN model to maintain high accuracy on unseen data.</li> <li>7. To reflect in the limitations of the implemented hybrid model and propose future research directions.</li> </ol>	
Draft of Rationale:	
<p>The integration of Explainable AI into deep learning models for MRI based brain tumor diagnosis is essential for clinical trust, technical reliability and regulatory compliance. Model like CNN can predict brain tumor by scanning MRI images but its "Black Box" nature limits safe medical use XAI addresses this by making model decision explainable and interpretable showing which features play's vital role for tumor detection. AIs ensure align with real tumor characteristics. This help not only builds clinician confidence and helps decision making but also help decision making but also help's detect bias, improve model efficiency enabling responsible and trustworthy deployment of AI in neuro-oncology.</p>	
Facilities required:	
<ul style="list-style-type: none"> <li>• dataset: Brain tumor MRI Images that are publicly available.</li> <li>• Computational Requirement: local computer or university facilities.</li> <li>• Cloud-based platforms such as google colab or Kaggle.</li> <li>• Software Requirements: Deep learning Framework (pytorch, Tensorflow, etc).</li> </ul>	

- Explainability libraries: SHAP, LIME, Grad-CAM implementations.
